

Airborne wind power generation system

Overview

What is airborne wind energy?

In this framework, a completely new renewable energy sector, Airborne Wind Energy (AWE), emerged in the scientific community. AWE aims at capturing wind energy at significantly increased altitudes. Machines that harvest this kind of energy can be referred to as Airborne Wind Energy Systems (AWESs).

How do airborne wind energy systems work?

Airborne wind energy (AWE) systems operate on the fundamental principle of converting the kinetic energy of wind into electricity. Unlike traditional wind turbines that are fixed to the ground, AWE devices fly at altitudes ranging from 100 to 1000 meters, where wind speeds are typically higher and more stable.

What is awe (airborne wind energy)?

In the literature, the acronym AWE (Airborne Wind Energy) is usually employed to designate the high-altitude wind energy resource as well as the technological sector.

What is ground-generator airborne wind energy systems (GG-AWES)?

In Ground-Generator Airborne Wind Energy Systems (GG-AWES) electrical energy is produced exploiting aerodynamic forces that are transmitted from the aircraft to the ground through ropes. As previously anticipated, GG-AWESs can be distinguished in devices with fixed or moving-ground-station.

Airborne wind power generation system

Airborne wind energy systems

Airborne system could, in principle, dynamically adjust its height and orientation to maximize its generation output over time, leading to higher capacity factors and better returns ...
