

Communication 5g signal tower base station energy method

Overview

How to evaluate a 5G energy-optimised network?

To properly examine an energy-optimised network, it is very crucial to select the most suitable EE metric for 5G networks. EE is the ratio of transmitted bits for every joule of energy expended. Therefore, while measuring it, different perspectives need to be considered such as from the network or user's point of view.

Does a balanced dataset improve energy prediction of 5G base stations?

For energy prediction of 5G base stations, this thesis finds that using a more balanced dataset, in terms of the number of samples for each product, has a positive impact for the ANN and the Gradient Boosted Trees model while the linear regression performs worse.

How can a 5G network improve performance?

As more radios and base stations are installed for 5G, the models can be improved by re-running the data collection and training the same models on this new data. This is believed to improve performance since it enables more data, both in terms of bulk and in terms of newly deployed features and measurements such as MicroSleepTime for NR, etc.

Can EMC communicate with a 5G network?

However, the communication operator builds the BS to complement the 5G signal, and the establishment of a communication BS does not mean the establishment of a dedicated power wireless network. EMC can also communicate by accessing a normal 5G network but at a reduced reliability and transmission rate.
