

Energy storage station DC power supply network

Overview

The high proportion of renewable energy access and randomness of load side has resulted in several operational challenges for conventional power systems. Firstly, this paper proposes the concept of a flexi.

Can DC be used as a next-generation power supply system?

Consequently, it can provide as a next-generation power supply system. Today's renewable energy sources and appliances actually favor DC, with the proliferation of PV, storage batteries, and consumer electronics, which all natively produce and consume DC in their internal components.

Does the DC power distribution system have a demonstration system?

In order to clarify the technical and safety issues of the DC power distribution system for practical use, a demonstration system has been installed as part of the power distribution system at the training center (Fig. 2). The demonstrative test started in July 2019.

What time does the energy storage power station operate?

During the three time periods of 03:00–08:00, 15:00–17:00, and 21:00–24:00, the loads are supplied by the renewable energy, and the excess renewable energy is stored in the FESPS or/and transferred to the other buses. Table 1. Energy storage power station.

When does the energy storage system choose not to discharge?

When the grid price is in the valley period, such as 15:00–18:00, the energy storage system chooses not to discharge regardless of the power shortage. Thereafter, the energy storage system initiates the discharging mechanism when the grid price is in the peak period starting period of 18:00.
