

Explanation of wind power publicity for solar container communication stations

Overview

Can a solar-wind system meet future energy demands?

Accelerating energy transition towards renewables is central to net-zero emissions. However, building a global power system dominated by solar and wind energy presents immense challenges. Here, we demonstrate the potential of a globally interconnected solar-wind system to meet future electricity demands.

Are solar and wind resources interconnected?

Theoretically, the potential of solar and wind resources on Earth vastly surpasses human demand 33, 34. In our pursuit of a globally interconnected solar-wind system, we have focused solely on the potentials that are exploitable, accessible, and interconnectable (see “Methods”).

What is interconnectability in offshore wind energy exploitation?

‘Interconnectability’ refers to the requirement that any proposed power plant must be located no farther than 10 kilometers from the existing transmission lines. Notably, offshore wind energy exploitation is confined to the exclusive economic zone.

How much electricity can a solar-wind power plant generate?

Our estimates suggest that the total electricity generation from global interconnectable solar-wind potential could reach a staggering level of $[237.33 \pm 1.95] \times 10^3$ TWh/year (mean \pm standard deviation; the standard deviation is due to climatic fluctuations).
