

Relationship between optical communication and base stations

Overview

What is an optical ground station?

Unlike a traditional ground station with a radiofrequency (RF) antenna, an optical ground station consists of a telescope and optoelectronic components for laser communication transmission and reception. The optical ground stations also integrate the latest addition to the Cortex family, the Cortex Lasercom.

Are optical communications a true revolution?

"We are convinced that optical communications are a true revolution, paving the way for new applications that will push the boundaries of current space communications," explains Sylvain Baissac, Commercial and Marketing Director of ground activities at Safran Data Systems.

How can a satellite communicate with a ground station?

Imagine ultra-fast data transfers between satellites and ground stations, enabling real-time transmission of high-definition data and images! This is made possible by optical technologies, which free space communications from the distance and range limitations of radiofrequency systems.

Where will optical ground stations be installed in 2022?

In 2022, Contec, a Korean New Space startup, selected Safran Data Systems to develop its network of Optical Ground Stations. Safran will deliver a turnkey optical OGS station, which will be installed on the West Coast of Australia in 2024.
