

# Solar panel roof ventilation

## Overview

---

### What is solar-powered roof ventilation?

Solar-powered roof ventilation is an environmentally conscious practice that utilizes clean, renewable solar energy to reduce dependence on fossil fuels and curb the carbon footprint associated with conventional electricity consumption.

### How does a solar roof ventilation system work?

Solar roof ventilation systems use photovoltaic panels to convert sunlight into electricity, powering fans that extract hot air from your attic. The process is elegantly simple: solar panels activate when exposed to sunlight (precisely when your attic heats up most), automatically drawing warm air out through roof vents.

### Do roof-integrated solar panels need ventilation?

With clear guidance on ventilation, contractors can install roof-integrated solar panels without compromising roof integrity or performance. In early 2024, the NHBC revised its Technical Standards, providing updated guidance on ventilation requirements for roof-integrated solar PV systems.

### Can roof ventilation enhance a solar installation?

For homeowners, builders, and architects aiming to maximise energy outcomes, it's worth understanding how the right roof ventilation can complement and even enhance a solar installation. Solar panels convert sunlight into electricity, but they don't perform at their best when they get too hot. Most panels are tested for efficiency at 25°C.
