

Solar panels follow the sun

Overview

What is a sun tracking solar panel?

Well, a solar panel collects energy from the sunlight and converts it into reusable energy. A sun-tracking solar panel typically does the same thing, but the only difference is that the tracker within these solar panels helps the device move in the sun's direction. A sun tracking solar panel tracks the energy from the sun on the X or Y axis.

How to ensure solar panels always face available sunlight?

A way to ensure solar panels always directly face available sunlight is to use solar trackers. A solar tracker is a mechanical device that tracks the position of the sun throughout the day by rotating or tilting an array of solar panels so as to capture maximum amount of solar energy.

What is a solar tracking system?

A solar tracking system is used to maximize direct radiation capture. It is commonly used with solar concentrators, which can focus solar energy using reflectors or lenses. A solar tracking system adds costs for the concentrators and steering system to the overall system.
