

# Solar panels generate electricity on islands

## Overview

---

How many kilowatts does a Malalison island solar power plant produce?

The Malalison Island solar photovoltaic hybrid power plant consists of a 50-kilowatt photovoltaic system with 273-kilowatt-hour lithium-ion batteries and a 54-kilowatt diesel back-up generator designed to produce 200 kilowatts power, around the clock. Could distributed energy resources boost the deployment of renewables on islands?

Distributed energy resources – or small-scale energy resources that are usually situated near sites of electricity use, such as rooftop solar – could play an important role in boosting the deployment of renewables on islands, increasing the security, resilience and affordability of power systems while accelerating decarbonisation.

Why do small islands need a new energy infrastructure?

Islands – including those that make up the group known as Small Island Developing States (SIDS) – also need to upgrade their energy infrastructure so that it is resilient to higher temperatures, more frequent natural disasters and flooding related to rising sea levels.

Why do small islands need electricity?

Electricity systems on small islands are frequently over-sized, with high reserve power generation capacity and ancillary services needed locally to respond to daily and seasonal fluctuations, such as changes in demand resulting from high and low tourist seasons.
