

Space Solar Base Station

Overview

What is space-based solar power (SBSP)?

Space-Based Solar Power (SBSP or SSP), the concept of gathering solar power in space using solar power satellites (SPS) to send it back to Earth, may sound like science fiction, but it is getting closer to reality. China plans to build a 1km-wide solar array in the geostationary orbit about 36,000km above Earth.

What is space-based solar power?

The plan involves constructing a colossal 1-kilometer-wide solar power station in geostationary orbit, approximately 36,000 kilometers above Earth. This endeavor aims to harness solar energy more efficiently than terrestrial methods, potentially ushering in a new era of clean, uninterrupted power supply. Why Space-Based Solar Power?

.

How do space-based solar power stations work?

“This is an incredible project to look forward to.” Space-based solar power (SBSP) stations work by using a system of mirrors to concentrate sunlight onto panels, which then generate electricity. The electricity is then converted to microwave radiation and beamed to a fixed antenna on Earth.

Will China build a solar power station in space?

It's coming to a cosmos near you in 25 years! China is currently planning to build a gigantic solar power station in space. To get parts of the array out of our atmosphere, scientists are working on a reusable heavy lift rocket called the Long March-9. The solar array project is just one small part of China's larger space mission.

Space Solar Base Station

Space-Based Solar Power

Purpose of the Study This study evaluates the potential benefits, challenges, and options for NASA to engage with growing global interest in space-based solar power (SBSP). ...
