The solar inverter lights up red

Overview

What does a red light on a solar string inverter mean?

Seeing an orange or red light on your solar string inverter is a clear indication that something might be wrong with your system. If your device is not working properly, it could be because of temporary factors like weather or time. But it could also be a sign of bigger issues like system faults or electrical power problems.

What happens if you ignore a red light on a solar inverter?

The red light serves as a clear indication of a fault or warning condition, and ignoring this alert can lead to more extensive damage to the system, potentially affecting both the inverter and the solar panels. Operations under such conditions can result in diminished energy production or even complete system failure.

Why is my inverter showing a red light?

If your inverter is showing a red light, start with a Power Cycle: Turn off the AC disconnect circuit breaker supplying power to the inverter. There should be an “AC DISCONNECT” sticker located on the box, typically right next to the inverter. Then, turn off the DC disconnect (typically built into the inverter).

Why is my solar string inverter light orange?

Observing an orange or red light on your solar string inverter instead of the usual green can signify a problem. It could be related to varying weather conditions, seasonal changes, or actual system faults like electrical issues, software glitches, or component malfunctions.
