

# What is the protective device of energy storage

## Overview

---

What is an energy storage device?

An energy storage device refers to a device used to store energy in various forms such as supercapacitors, batteries, and thermal energy storage systems. It plays a crucial role in ensuring the safety, efficiency, and reliable functioning of microgrids by providing a means to store and release energy as needed.

What are energy storage systems?

Energy storage systems are devices capable of carrying out these transformations in an efficient and controlled way, allowing to better manage energy supply and demand nationwide. What is an energy storage system?

An energy storage system is a device or set of devices that can store electrical energy and supply it when needed.

What are surge protective devices (SPDs) in battery energy storage systems?

Surge protective devices (SPDs) is required in Battery Energy Storage Systems (BESS) BESS systems contain AC/DC converters and battery banks implemented in concrete constructions or in metallic containers.

Do energy storage systems need application-specific protection?

As demand for electricity becomes ever greater, the need to store energy (as well as produce it) also does. Like all electrical installations, energy storage systems need application-specific protection. Energy Storage Systems (ESS) are now a mature technology.
